ECSE 443 - Assignment 1

*** USED ROUNDING UP FOR 5-9 NUMBERS AND ROUND DOWN FOR 0-4 NUMBERS.

Question 1 - a) MATLAB values, Refer to appendix A, section a

x =	10	1000	1000000
F(x)	1.6227766016838	15.8153431255768	500.0001250000625

b) Calculator values: For these calculations I used my computer calculator which kept the most significant digits when compared to a standard calculator. This is due to the fact I wanted to keep as many digits as possible before rounding down.

$$f(x) = x * \left(\sqrt{x} - \sqrt{x - 1}\right)$$

For x = 10:

$$f(10) = 10 * (\sqrt{10} - \sqrt{9})$$
$$f(10) = 10 * (3.16228 - 3.00000)$$
$$f(10) = 10 * (0.16228)$$

For x = 1000:

$$f(1000) = 1000 * (\sqrt{1000} - \sqrt{999})$$
$$f(1000) = 1000 * (31.6228 - 31.6070)$$
$$f(1000) = 1000 * (0.0158000)$$

For x = 1000000:

I used my computer calculator and calculated 999.9994... which is a round down to 999.999 for 6 significant figures.

$$f(1000000) = 1000000 * \left(\sqrt{1000000} - \sqrt{999999}\right)$$

$$f(1000000) = 1000000 * (1000 - 999.999)$$
$$f(1000000) = 1000000 * (0.001)$$

x =	10	1000	1000000
F(x)	1.6228	15.8000	1000

c) Matlab Error Results with Calculator results. Refer to appendix A, section c.

x =	10	1000	1000000
Absolute Error	0.0000233983162	0.0153431255768	499.9998749999375

χ =	10	1000	1000000
Percent Relative Err (%)	0.001441869212467	0.097014180817616	99.999949999987507

The error associated with the results calculated with the calculator is from the limited number of significant figures that we can use in order to do the calculations. Therefore, we lose precision throughout the operations.

d) Refer to appendix A, section d for calculation.

Starting Function:

$$f(x) = x\left(\sqrt{x} - \sqrt{x-1}\right) \frac{\sqrt{x} + \sqrt{x-1}}{\sqrt{x} + \sqrt{x-1}}$$

Simplified:

$$f(x) = \frac{x}{\sqrt{x} + \sqrt{x - 1}}$$

For X = 10:

$$f(10) = \frac{10}{\sqrt{10} + \sqrt{10 - 1}}$$
$$f(10) = \frac{10}{3.16228 + 3.0}$$
$$f(10) = \frac{10}{6.16228}$$

For X = 1000:

$$f(1000) = \frac{1000}{\sqrt{1000} + \sqrt{1000 - 1}}$$
$$f(1000) = \frac{1000}{31.6228 + 31.6070}$$
$$f(1000) = \frac{1000}{63.2298}$$

For X = 1000000:

$$f(1000000) = \frac{1000000}{\sqrt{1000000} + \sqrt{1000000 - 1}}$$
$$f(1000000) = \frac{1000000}{1000 + 999.999}$$
$$f(1000000) = \frac{1000000}{1999.999}$$

χ =	10	1000	1000000
F(x)	1.62278	15.8153	500.000

e) Matlab Error Results compared with modified function results in d). Refer to appendix A, section e.

x =	10	1000	1000000
Absolute Error	3.398316206660e-6	4.3125576773662e-5	1.25000062496383e-4

x =	10	1000	1000000
Per Relative Err (%)	2.09413680424876e-4	2.72681891447036e-4	2.5000006249272e-5

The calculated error between the Matlab calculation and the modified function is lower for most inputs due to the elimination of subtraction in the function. When the subtraction operation occurs, it leads to a lost of significant figures when the two operands are close to one another. Therefore, the removal of this operation allows for a more precise result.

Question 2 - a) MATLAB values, Refer to appendix B, section a

X=	0.007
F(x)	0.003500014291736696180563008388486

b) Again, I used my computers calculator to perform the calculations due to its extra significant figures therefore when I perform my rounding later it less likely to be affected by initial rounding made by my standard calculator.

$$f(x) = \frac{1 - \cos(x)}{\sin(x)}$$
$$1 - \cos(0.0)$$

$$f(0.007) = \frac{1 - 0.999976}{0.00699994}$$
$$f(0.007) = \frac{0.000024}{0.00699994}$$

X=	0.007
F(x)	0.00342860

c) Refer to appendix B, section c.

X=	0.007
Absolute Error	0.000071414291736696216917261329836799
Percent Relative Error (%)	2.040400003660004142025675973315

The error associated with the results is from the limiting number of significant figure which limits the precision of the result compared to when we use all the significant figures.

d) Refer to appendix B, section d for calculation.

Original Function:

$$f(x) = \frac{1 - \cos(x)}{\sin(x)} \frac{1 + \cos(x)}{1 + \cos(x)}$$

$$f(x) = \frac{1 - \cos^2(x)}{\sin(x) (1 + \cos(x))}$$

$$f(x) = \frac{\sin^2(x)}{\sin(x)(1+\cos(x))}$$

Simplified Function:

$$f(x) = \frac{\sin(x)}{1 + \cos(x)}$$

For X = 0.007:

$$f(0.007) = \frac{sin(0.007)}{1 + \cos(0.007)}$$

$$f(0.007) = \frac{0.00699994}{1 + 0.999976}$$

$$f(0.007) = \frac{0.00699994}{1.999976}$$

X=	0.007
F(x)	0.00350001

e) Matlab Error Results compared with modified function results in d). Refer to appendix B, section e.

X=	0.007
Absolute Error	0.0000000042917366961670926724307090239394
Percent Relative Error (%)	0.00012262054775889347305826475631838

Similarly, to above in Q1, section e, the absolute and percent relative error are both much smaller due to the removal of the subtraction operation. The subtraction operation results in a loss of significant figures when the operations are similar.

Question 3 – a)

Initial Function:

$$f(x) = e^{-4x} \cos(6x)$$
$$f'(x) = e^{-4x} (-4) \cos(6x) + e^{-4x} (-\sin(6x)) (6)$$

Derivative Function:

$$f'(x) = -4e^{-4x}\cos(6x) - 6e^{-4x}\sin(6x)$$

Solve for X = 0.5

$$f'(0.5) = -4e^{-4*0.5}\cos(6*0.5) - 6e^{-4*0.5}\sin(6*0.5)$$

$$f'(0.5) = -4e^{-2}\cos(3) - 6e^{-2}\sin(3)$$

$$\equiv \text{ Scientific}$$

$$e^{\wedge}(-2) \times \sin_{r}(3)$$

$$0.14112000805986722210074480280811$$

$$\equiv \text{ Scientific}$$

$$\cos_{r}(3) \times e^{\wedge}(-2)$$

$$0.13533528323661269189399949497248$$

f'(0.5) = 0.53592365971817045384562102184462 - 0.11459109756681117859545744515281

Final Answer:

$$f'(0.5) = 0.42133256215135927525016357669181$$

b) Refer to appendix C, section b.

Output from Matlab: output = 0.43847880243653103711684144164038

c) The manual calculation is shown below, however it is also done in Matlab.

Taylor Series of e^{-4x} :

$$e^{x} = 1 + x + \frac{x^{2}}{2!} + \frac{x^{3}}{3!} + \frac{x^{4}}{4!} + \cdots$$

$$e^{-4x} = 1 + (-4x) + \frac{(-4x)^{2}}{2!} + \frac{(-4x)^{3}}{3!} + \frac{(-4x)^{4}}{4!} + \cdots$$

$$e^{-4x} = 1 - 4x + \frac{16x^{2}}{2!} - \frac{64x^{3}}{3!} + \frac{256x^{4}}{4!} + \cdots$$

Taylor Series of cos(6x):

$$\cos(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} + \cdots$$
$$\cos(6x) = 1 - \frac{(6x)^2}{2!} + \frac{(6x)^4}{4!} - \frac{(6x)^6}{6!} + \frac{(6x)^8}{8!} + \cdots$$

Multiply the first 3 terms:

$$e^{-4x}\cos(6x) = \left(1 - \frac{36x^2}{2!} + \frac{1296x^4}{4!}\right)\left(1 - 4x + \frac{16x^2}{2!}\right)$$

$$e^{-4x}\cos(6x) = \left(1 - 18x^2 + 54x^4\right)\left(1 - 4x + 8x^2\right)$$

$$e^{-4x}\cos(6x) = 1 - 4x + 8x^2 - 18x^2 + 72x^3 - 144x^4 + 54x^4 - 216x^5 + 432x^6$$

$$f(x) = e^{-4x}\cos(6x) = 1 - 4x - 10x^2 + 72x^3 - 90x^4 - 216x^5 + 432x^6$$

$$f(x) = e^{-4x}\cos(6x) = 1 - 4x - 10x^2$$

Take the derivative:

$$x + h = 0.51$$

$$f(0.51) = 1 - 4(0.51) - 10(0.51)^{2}$$

$$f(0.51) =$$

$$f(0.5) = 1 - 4(0.5) - 10(0.5)^{2}$$

The work is also done in Matlab to compare answers in appendix C, section c. Final result is:

$$out_c = -14.1$$

d) Refer to **appendix C**, section d for the program to determine the minimum step size of a function. The final output for the minimum step size is:

<u>Question 4</u> – a) Refer to appendix D, section a for the script and work done. The final answer is illustrated bellow.

X ₁	-4.7708333333333334
X ₂	-4.450757575757576
X ₃	3.757575757575756
X ₄	5.5757575757576

b) Refer to **appendix D**, section b and the function **gaussElim**, **in appendix E** for the implementation of the function.

X ₁	-4.770833333333333
X ₂	-4.450757575757579
X ₃	3.757575757575760
X ₄	5.575757575757579

c) Refer to appendix D, section c. The absolute error for each entry was calculated as the following.

The maximum absolute error is:

<u>Question 5</u> – a) Refer to appendix F, section a to the steps in order to calculate the following Taylor Series.

$$f_t(x) = \frac{x^2}{2} + x + 1$$

b) Refer to appendix **F**, section b.

c)

Starting Function:

$$f(x) = e^{\sin x}$$

Solve x = 0.01:

$$f(0.01) = e^{\sin(0.01)}$$

f(0.01) = 1.01005

d) The results are relatively similar however, the result for c using the regular function will be more precise due to the fact that it is doing less approximation. In the case of the Taylor Series, we are approximating the value using the first 3 terms which leaves x^4 error in the answer.
